

This 4 model is shown with instep and forefoot straps, standard padding and toe rise. Other straps are available.

Can be appropriate for both severely and mildly involved patients. Design of the brace is like a lightweight hiking boot with its high front and back cut out. Because of the wraparound hindfoot trimline, the brace's ability to control the hindfoot is greatly increased over the Maximum Control Orthotic DAFO 5. Trimline meets in front with the closure firmly maintained by the instep strap. Gives an exceptional amount of alignment control at the forefoot and hindfoot, while allowing the ankle free plantarflexion and dorsiflexion.

**USE WITH PATIENTS WHO:**

1. Have strong fixing patterns of pronation and/or supination.
2. Have delayed development with very low tone pronation and sensory issues
3. Need high levels of specific foot correction but have adequate ankle control for functional level
4. High levels of floor activities requiring free ankles

**Hindfoot:** excellent, wraparound control.

**Forefoot:** excellent, wraparound control, hindfoot stable

**Ankle:** FREE plantarflexion/dorsiflexion; good medial- lateral control with "ears" of splint.
